- [System Calls](#)
- [Interactives](#)
- [Plugins](#)

Use these tools for partial testing!

Primary Features

- End Step ends the step and moves on to the following step.
- End Scenario terminates the scenario.
- They can be used in **Conditional Branching** to isolate operations.
- They can be used for testing part(s) of the scenario by disabling the operations before, after, and in-between.

- Example of using these tools for Conditional Branching.

The screenshot displays a test automation tool interface. On the left, a list of operations is shown:

- 1 **CompareValue** (Operation 3)
- 2 **TextInput** (Operation 4)
- 3 **End of Step** (Operation 5)
- 4 **TextInput** (Operation 6)
- 5 **End of Scenario** (Operation 7)

A yellow callout box points to the 'CompareValue' operation, stating: "In this example, Compare Value is used to set up a conditional branching of the automation."

Another yellow callout box explains the logic: "If the comparison result is true, the bot will execute operation 3 and then move on to the next step. If the comparison yields false, the bot will execute operation 4 and ends the scenario".

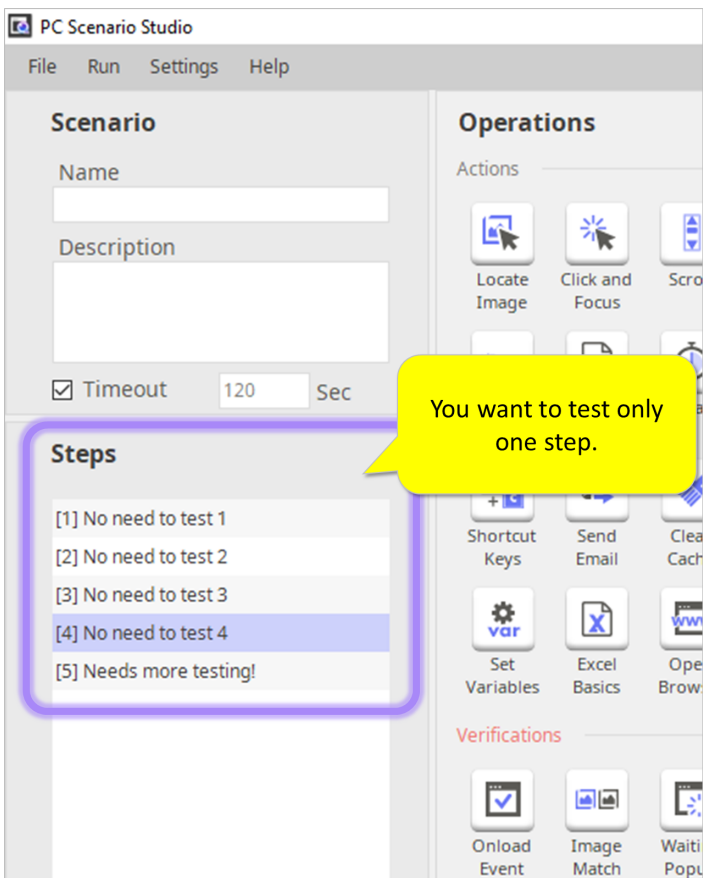

The right panel shows the configuration for the 'CompareValue' operation:

- Verification: **CompareValue**
- Operation name: Operation 3
- Properties: `{{Global.second}}` `==` `{{Global.second}}`
- Result handler:
 - True: MoveOn
 - False: JumpToOperation
 - Operation number: 4

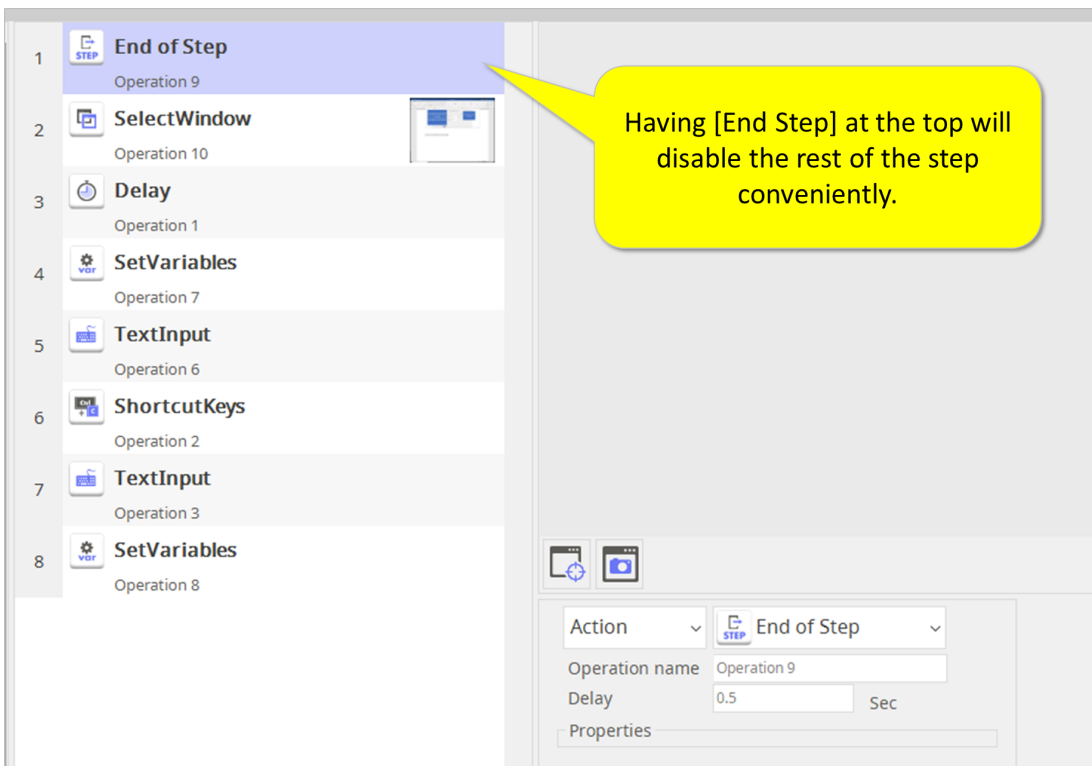

A yellow callout box points to the 'JumpToOperation' result handler, stating: "Conditional Branching is defined here".

At the bottom of the interface, there are icons for play, add, and delete.

- Example of using End Step for partial testing.
When you have many steps but there is only one you want to test.

- Place End Step at the top of all the other steps.
